Does electrode-sheet-based calculation of battery cells based on a traceability system work?

The fluctuations in the calculated and measured capacities of the battery cells can thus be explained. In summary, the results show that the electrode-sheet-based calculation of the capacities using the integrated traceability system is close to the actual measured values with minor deviations.

Are lithium-ion batteries a complex process?

Lithium-ion batteries, which serve as energy storage systems for electric vehicles, undergo a long and complex process chain. [5,6] Continuous and discrete material flows within this process chain make it difficult to assign product and process data to intermediate and final products.

Is there a conflict of interest in a lithium-ion battery production?

Open Access funding enabled and organized by Projekt DEAL. The authors declare no conflict of interest. The production of lithium-ion batteries consists of a long and complex process chain. The individual process steps influence each other, resulting in unknown cause-and-effect interactions.

How can digital twins of battery cells be characterized?

Using the traceability system, digital twins of manufactured battery cells can now be created down to the electrode sheet level. This makes it possible to characterize the defined TRU using the recorded production data.
