What are the four topologies of energy storage systems?

The energy storage system comprises several of these ESMs, which can be arranged in the four topologies: pD-HEST, sD-HEST, spD-HEST, and psD-HEST. Detailed investigations will be undertaken in future work to examine special aspects of the proposed topology class.

What is a D-Hest energy storage topology?

We suggest the topology class of discrete hybrid energy storage topologies (D-HESTs). Battery electric vehicles (BEVs) are the most interesting option available for reducing CO₂ emissions for individual mobility. To achieve better acceptance, BEVs require a high cruising range and good acceleration and recuperation.

Are reconfigurable energy storage topologies possible without DC/DC converters?

Besides, reconfigurable topologies on cell level and module level, without the need of additional DC/DC converters, have been investigated in the literature and are also presented and reviewed. We then suggest a new topology class of discrete hybrid energy storage topologies, which combine both research topics.

What are the basic interconnection topologies of energy storage elements?

Basic interconnection topologies of energy storage elements having the same cell type and chemistry. (a) Serial interconnection, (b) parallel interconnection, and (c) parallel-serial interconnection to increase storable energy, capacity, or ampacity and/or achieve a higher output voltage.
