Which configuration is best for PV-Grid charging?

For PV-grid charging, isolated or flyback configurations are preferred as they provide galvanic isolation between the ac and dc systems and capable of providing a wide range of voltage level conversion in both directions.

How many charging modes are there in a PV-Grid charging system?

For the PV-grid charging system that employs ESU, there are nine possible charging modes stated below and illustrated in Fig. 5. In Mode 1, when no EV is connected to the charger and the ESU is fully charged, the entire PV power is sold to the grid. This situation is shown in Fig. 5 (a). Here, Fig. 5.

Is a PV-Grid system more profitable than a standard grid system?

Bhatti et. al. present the case study on charging using a standard grid system, PV-grid system and PV-standalone in the presence of energy storage unit (battery banks). The study concludes that the PV-grid system is more profitable compared to the PV-standalone and standard grid charging systems.

What is a bidirectional inverter for EV charging?

The bidirectional inverter for EV charging has a dual function: if the power on the dc bus is to be fed back to the grid, it operates as a dc-ac converter (i.e. in inversion mode). On the other hand, if power needs to be drawn from the grid to charge the dc bus, it has to be configured as an ac-dc converter (rectification mode).
