Tanker trucks replenish liquid hydrogen (LH2) within large sphere at NASA's Kennedy Space Center in Florida, Launch Pad 39B. Thank you for your attention.

This edited guide to direct liquid fuel cells (DLFCs) provides readers with a detailed discussion of their characteristics, mechanisms, and role in global decarbonization.

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy ...

Passive fuel cells, using diffusion and natural convection for fuel delivery, are regarded as promising candidates for powering portable devices including mobile phones and laptops.

Herein, we demonstrate reduced phosphotungstic acid as a liquid fuel for DLFCs based on its advantages of high chemical and electrochemical stability, high electrochemical activity on ...

With nanoFlowcell[®], the energy is likewise stored in liquid electrolytes held in two separate tanks and pumped through a converter in a fashion similar to a traditional redox flow cell or fuel cell.

The advantages of liquid fuel cells (LFCs) over conventional hydrogen-oxygen fuel cells include a higher theoretical energy density and efficiency, a more convenient handling of the streams, and enhanced ...

Owing to the poor reactivity of conventional liquid fuels, they not only require noble metal catalysts for their oxidation but also exhibit limited performance. Here, we report a power-generation ...

OverviewHistoryDesignEvaluationTraditional flow batteriesHybridOrganicOther typesA flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Ion transfer inside the cell (accompanied by current flow through an external circuit)

occurs across the membrane while the liquids circulate in their respective spaces.

Here, we develop a model for a liquid e-fuel cell by incorporating fluid flow, electroactive species, experimental data in the open literature. The model allows to study the effects of various, the ...
