What is a grid-connected solar system?

As the name suggests, a grid-connected solar system is tied to the utility grid. What distinguishes it from other solar setups is that the energy runs in two different ways. When your household requires more energy than your solar system generates, the house draws in energy from the utility.

How do I connect my solar panels to the grid?

Follow a structured process to connect your solar panels to the grid, including preparing the electrical panel, installing a dedicated circuit breaker, wiring the inverter, and setting up a utility disconnect switch. Familiarize yourself with net metering to maximize your energy savings.

How does a solar farm connect to the grid?

All solar farms connect to a specific point on the electrical grid, the vast network of wires that connects every power generation plant to every home and business that consumes power. That point is called the "point of interconnection," or POI.

What is a grid-tied solar system?

Grid-tied solar systems allow you to use solar energy during the day, sell excess power back to the utility through net metering, and draw from the grid when needed. However, proper grid connection requires careful planning, safety compliance, and often professional assistance.
