Does solar energy affect land use change?

Although the transition to renewable energies will intensify the global competition for land, the potential impacts driven by solar energy remain unexplored. In this work, the potential solar land requirements and related land use change emissions are computed for the EU, India, Japan and South Korea.

How much land does solar energy occupy?

A novel method is developed within an integrated assessment model which links socioeconomic, energy, land and climate systems. At 25-80% penetration in the electricity mix of those regions by 2050, we find that solar energy may occupy 0.5-5% of total land.

Is solar energy a good option for land use?

However, recent studies based on satellite views of utility-scale solar energy (USSE) under operation, either in the form of photovoltaics (PV) or concentrated solar power (CSP), show that their land use efficiency (LUE) is up to six times lower than initial estimates^{17,18,19}.

Can unused lands be used to build PV solar farms?

According to the land use policy in China, unused lands, such as deserts, gobi, and wastelands, were considered most suitable for constructing PV solar farms. Using unused lands such as Gobi, desert and wasteland to build PV plants can reduce the construction cost of photovoltaic projects and improve the economy.
