For decades, researchers have sought a more reliable battery than lithium ion. Solid-state batteries are less flammable and can hold more energy, but they often require intense pressure to...

Solid-state batteries are less flammable and can hold more energy, but they often require intense pressure to function. This requirement has made them difficult to use in applications, but new ...

A group of researchers from the Georgia Institute of Technology have developed aluminum foil-based anode for all-solid state batteries with higher energy density and greater stability.

The Georgia Solid State Battery Market is experiencing significant growth driven by the increasing demand for electric vehicles, portable electronics, and renewable energy storage solutions.

Hyundai Motor Group Metaplant America (HMGMA) is an electric vehicle (EV) production site operated by Hyundai and located in Ellabell, Bryan County, Georgia, United States. The \$7.6 billion campus ...

Researchers at the Georgia Institute of Technology in Atlanta have identified ferric chloride (FeCl_3) as a promising new cathode material for solid-state batteries, potentially leading to ...

Researchers at the Georgia Institute of Technology in Atlanta, USA, see massive potential reductions in both cost and use of critical raw materials by using ferric chloride (FeCl_3) as a ...

In a remarkable development shedding light on the future of energy storage, researchers at the Georgia Institute of Technology in Atlanta have unveiled a low-cost cathode material for solid-state batteries ...
